# Biometric Authentication

By Veriff

Go passwordless and secure accounts easily

Take a step beyond passwords and one-time passcodes to secure customer accounts with facial biometric technology. It's as fast and easy as taking a selfie.

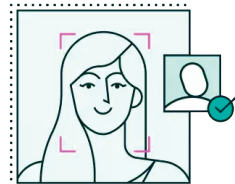

Make authentication easier and more secure

Facial biometrics enables the simplest, most secure authentication experience.

1s response time

Using just a selfie, authenticate any user's identity in one second

100% automation

Fully automated facial recognition technology

99.99% accuracy

Highly accurate face detection and biometric authentication

99% first-time match

With assisted image capture built in, authenticate users on their first try

How it works

A simple and seamless way to mitigate fraudulent activities such as account takeover and identity theft.

1. Ask for a selfie

Replace the legacy knowledge-based authentication (KBA), one-time passwords, and email authentication - all with one selfie.
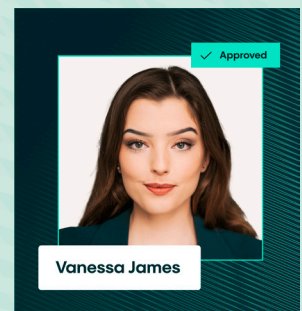

2. Liveness checks

Veriff checks the picture for liveness and realness in real-time and stops anyone with a printout or an image on a mobile device.

3. Face matching

The selfie is then compared and matched to a previously verified face and identity that you already have on file.

4. Decision

The user is sent back to your platform and the decision is provided in one second. If successful, your user can proceed to access their account and data.

Replace cumbersome legacy authentication methods with Veriff's Biometric Authentication, making it simple for users and strengthening security. Get in touch with us to get started.
